BIOPHEN FVII
Ref: 221304 (R1, R3: 2 x 4 mL; R2: 2 x 2 mL; R4: 4 x 25 mL)

Chromogenic assay for quantitative determination of factor VII
FOR RESEARCH USE ONLY.
NOT FOR USE IN DIAGNOSTIC PROCEDURES

INTENDED USE:
The BIOPHEN FVII kit is a chromogenic method for quantitative determination of the factor VII activity in purified medium or citrated plasma using a chromogenic method, manual or automated. This kit is for research use only and should not be used for patient diagnosis or treatment.

SUMMARY AND EXPLANATION:
Factor VII is the serine esterase of the extrinsic coagulation pathway. When complexed to Tissue Factor (TF), in presence of phospholipids and Calcium, it activates Factor Xa to Factor Xa. BIOPHEN FVII kit is a chromogenic assay for testing Factor VII activity.

ASSAY PRINCIPLE:
In the presence of tissue factor (rabbit thromboplastin) and calcium, factor FVII forms an enzymatic complex which activates the factor Xa, present at a constant concentration and in excess, to factor Xa. The factor Xa formed cleaves the specific substrate FVa (FVa-11) and releases pNA. The amount of pNA generated is directly proportional to the Factor Xa activity.

The amount of Factor VII in the assayed sample is directly proportional to the Factor Xa activity generated, measured by the amount of pNA released, determined by color development at 405 nm.

REAGENTS:
R1: Reagent 1: Factor X (Human), lyophilized. Contains Factor X at the optimized concentration for the assay, 2 vials of 4mL.
R2: Reagent 2: Thromboplastin Calcium, lyophilized. Contains rabbit brain thromboplastin and calcium. 2 vials of 2mL.
R3: Reagent 2: Sxa-11, lyophilized. Chromogenic substrate, specific for Factor Xa (Sxa-11). Contains 8 mg of Sxa-11. 2 vials of 4mL.
R4: Reagent 4: Tris-BSA buffer at pH7.40, ready to use.

Reagent 4 contains low concentration of Sodium azide (0.9 g/L), see CAUTIONS AND WARNINGS.

PREPARATION AND STABILITY OF REAGENTS:
Vials are closed under vacuum. Remove carefully the stopper, in order to avoid any loss of powder when opening the vials.

R1: Reconstitute each vial with exactly 4 mL of distilled water, shake thoroughly for complete dissolution. Let the reagent stabilize for 30 min at room temperature (18-25°C), while shaking from time to time. Homogenize the reagent before each use.
Stability of reconstituted reagent, provided that any contamination or evaporation is avoided, kept in its original vial is:
- 48 hours at 2-8°C.
- 8 hours at room temperature (18-25 °C).
- Do not freeze.

R2: Reconstitute each vial with exactly 2 mL of distilled water, shake thoroughly for complete dissolution. Let the reagent stabilize for 30 min at room temperature (18-25°C), while shaking from time to time. Homogenize the reagent before each use.
Stability of reconstituted reagent, provided that any contamination or evaporation is avoided, kept in its original vial is:
- 48 hours at 2-8°C.
- 8 hours at room temperature (18-25 °C).
- Do not freeze.

R3: Reconstitute each vial with exactly 4 mL of distilled water, shake thoroughly for complete dissolution. Let the reagent stabilize for 30 min at room temperature (18-25°C), while shaking from time to time. Homogenize the reagent before each use.
Stability of reconstituted reagent, provided that any contamination or evaporation is avoided, kept in its original vial is:
- 3 months at 2-8°C.
- 7 days at room temperature (18-25 °C).
- Do not freeze.

R4: Ready to use. Homogenize the reagent before each use.
The reagent, provided that any contamination or evaporation is avoided, kept in its original vial is stable until the expiration date printed on the label when stored at 2-8°C.

STORAGE CONDITIONS:
Unopened reagents must be stored at 2-8°C, in their original packaging box. They are then usable until the expiration date printed on the label.

REAGENTs AND MATERIAL. REQUIRED BUT NOT PROVIDED:
Reagents:
- Distilled water.
- 20% acetic acid or 2% citric acid (end point method).
- Specific Calibrators and controls with a known concentration such as:

<table>
<thead>
<tr>
<th>Product Name</th>
<th>Reference</th>
</tr>

Materials:
- Spectrophotometer or automatic instrument for chromogenic assays.
- Stopwatch; Calibrated pipettes; Plastic tubes or microplate.

SPECIMEN COLLECTION:
Preparation and storage of specimens must be performed according to the current local regulations.
- Specimens:
  - Human plasma obtained from anticoagulated blood (trisodium citrate).
- Collection:
  - Blood (9 mL) must be collected on trisodium citrate anticoagulant (1 vol.) (0.109M), with caution, through a net venipuncture. The first tube must be discarded.
- Centrifugation:
  - Within 2 hours, use a validated method in the laboratory to obtain a platelet-poor plasma, e.g., a minimum of 15 minutes at 2500 g at room temperature (18-25°C) and plasma must be decanted into a plastic tube.
**TEST PROCEDURE:**
The BIOPHEN FVII kit can be used for kinetics methods, automated on instruments, or by manual method (end point). The assay is performed at 37°C and the color intensity is measured at 405 nm.

**Automated methods:** Applications to the various analyzers are available upon request. Refer to each specific application and specific cautions for each analyzer.

**Assay method:**
1. For the plasmatic medium, calibration is performed with a plasma calibrator with a concentration (C) in Factor VII precisely defined or a normal pooled citrated plasma (at least 30 normal individuals, males or females, aged between 18 and 55 years, and free of any medication or disease), with the assigned value of 100 % Factor VII. The assay includes a standard plasma dilution of 1:1000. By definition, this latter dilution of the pool represents the 100% Factor VII activity. The dynamic range is from 0.1 to 200% Factor VII. The 200% Factor VII activity is the 1:500 dilution of the plasma pool or calibrator. The 1:1000 dilution corresponds to the indicated Factor VII concentration (C), and the 1:500 to twice this concentration. For a calibrator titrating C, the 200% FVII concentration is obtained (in the assay conditions) by using the following dilution factor: 1:500.

   In order to have an accurate dilution, predilute the pool plasma at 1:25, then 1:20 with Tris-BSA buffer (R4) to obtain a 1:500 final dilution (i.e. 200% factor VII). Using this dilution, prepare the calibration range as indicated here below:

<table>
<thead>
<tr>
<th>FVII (%)</th>
<th>0</th>
<th>50</th>
<th>100</th>
<th>200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plasma calibrator diluted 1-500 (µL)</td>
<td>0</td>
<td>125</td>
<td>250</td>
<td>500</td>
</tr>
<tr>
<td>RA: Tris-BSA buffer (µL)</td>
<td>500</td>
<td>375</td>
<td>250</td>
<td>0</td>
</tr>
</tbody>
</table>

2. Dilute the samples using Tris-BSA buffer (R4) as described in the table below:

<table>
<thead>
<tr>
<th>Sample</th>
<th>Reference</th>
<th>Dilution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controls</td>
<td>223201-RUO</td>
<td>1:1000</td>
</tr>
<tr>
<td>Specimen</td>
<td>n.a.</td>
<td>1:1000</td>
</tr>
</tbody>
</table>

Run the calibration curve and test it with quality controls. Diluted sample have to be tested within 2 hours when stored at room temperature (18-25°C).

3. For purified medium with Factor VII concentrations different from that of plasma, dilute the sample in R4 in order to get a final Factor VII concentration in the tested dilution in the range 0.1 to 1ng/mL (i.e. 20 to 200% Factor VII, using this protocol).

4. In a plastic tube or in microassay well, incubated at 37°C, introduce:

<table>
<thead>
<tr>
<th>Microplate</th>
<th>Test tube</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calibrators, Controls, or tested plasmas diluted 1:1000</td>
<td>30µL</td>
</tr>
<tr>
<td>R2: Thromboplastin Calcium preincubated at 37°C</td>
<td>30µL</td>
</tr>
<tr>
<td>R1: Factor VII standard preincubated at 37°C</td>
<td>60µL</td>
</tr>
<tr>
<td>Mix and incubate at 37°C for 5 minutes, then introduce</td>
<td></td>
</tr>
<tr>
<td>R4: BSA-Ti preincubated at 37°C</td>
<td>50µL</td>
</tr>
<tr>
<td>Mix and incubate at 37°C for exactly 5 minutes</td>
<td></td>
</tr>
<tr>
<td>Stop the reaction by introducing</td>
<td></td>
</tr>
<tr>
<td>Coac acid (2%)</td>
<td>5mg</td>
</tr>
<tr>
<td>Mix and measure the absorbance at 405nm against the corresponding blank.</td>
<td></td>
</tr>
</tbody>
</table>

**CALIBRATION:**
The BIOPHEN FVII assay can be calibrated for measurement of Factor VII. The assay can be calibrated for measurement of Factor VII. The test dynamic range is available at HYPHEN BioMed (see table in the REAGENTS AND MATERIALS REQUIRED BUT NOT PROVIDED section) and can be used to generate calibration curves. The calibration curve below, obtained with the calibrator BIOPHEN Plasma Calibrator on STA-R® is indicated as an example only. The calibration curve generated for the series of measures performed must be used.

**QUALITY CONTROL:**
Using quality controls allows validating the calibration curve, as well as the homogeneity of reactivity from run to run, when using a same lot of reagents. Quality control must be included in each series, as per good laboratory practice, in order to validate test results. A new calibration curve must be carried out preferentially for each test series, and at least for each new lot of reagents or, after each important analyzer’s maintenance, or when quality controls values are measured outside the acceptance range determined for the method. Each laboratory has to establish and verify its own target values, acceptance ranges and expected performances, according to the instruments and protocols used.

**RESULTS:**
- For the end point manual method, draw the calibration curve on a logarithmic graph paper plot, with an abscissa, the Factor VII concentration (%) and on ordinate the corresponding absorbance OD405 (nm).
- The FVII concentration in the tested specimen is directly deduced from the calibration curve.
- Results are expressed as % of factor VII.
- When the assay dilution is 1:1000, the factor VII concentration is directly read on the calibration curve. When different dilutions are used, the rate measured must be multiplied by the dilution factor “D”, divided by 1000, i.e. D/1000.

The results obtained should be for research purposes only and not used for patient diagnosis or treatment.

**LIMITATIONS:**
- In order to get the optimal performances of the assay, the technical instructions must be strictly followed.
- Any reagent presenting an unusual aspect or contamination signs must be rejected.
- Any plasma containing a coagulum or contamination signs must be rejected.

**PERFORMANCES:**
- The lower limit of detection is ± 5%.
- The assay working range is from 5 to 200%.
